

If you have been put in quarantine:

--It does not mean you have the Covid-19 virus, but you may have been directly exposed.

--It does not mean that everyone in the school has been exposed to the virus. In many cases, the exposure is limited to a particular grade or class.

--You will not come to school for the time that has been set by the school to stay home. This ranges between 10-14 days.

--You need to stay home. If you have the virus, you could spread it if you are out and about.

--If your family stays together, you will all need to quarantine. If your family quarantines separately, those who were not possibly exposed could continue with work outside the home.

--If your family quarantines together, consider using grocery pickup to avoid spreading the virus in stores.

Primary exposure: Possible direct exposure from someone that had a test come back positive. This will result in a quarantine.

Secondary exposure: No direct exposure from someone that had a test come back positive. You will not be quarantined, but be observant if your health changes and you develop symptoms.
